

A close-up photograph of a human hand held palm-up, with a small amount of dark brown soil resting in the center. The background is a blurred field of similar soil, creating a sense of depth and focus on the soil being held. The lighting is warm, highlighting the texture of the skin and the granules of the soil.

## Overpopulation

OVERVIEW

In the year 1 C.E. there were approximately 200 million people on Earth—less than the population of the contemporary United States alone. It took nearly two thousand years for the global population to increase sixfold: In 1850 the world population was an estimated 1.26 billion. The next increase of nearly sixfold has taken only 150 years, less than one-tenth the time of the previous sixfold jump: As of 2008 the world human population was 6.5 billion. This rapidly increasing growth rate of population, with attendant steep increases in consumption of natural resources, threatens the well-being of Earth's current and future inhabitants.

Environmental philosophers hold differing views on how humans affect the environment. Many questions and controversies have arisen in relation to the issue of population: Are resources disappearing? How do consumption patterns of a rising population change the human impact on the planet? Is there an optimal size of ... [VIEW FULL OVERVIEW](#)
